Hi,

I am using the IDL GUI builder and i want a display with two plotting window and 2 buttons on one page. Basically how do you link each button to the desired plotting window. At the moment my plot appears in the last plot window i create. Any ideas?

many thanks

Clive cook

Sorry, I meant. ...little over double the code it took to write the event loop in GUI builder.

Well, that's an interesting little program. Living in the time zone you do, I hope you have a broadband connection. I expect you are going to be getting some e-mail. :-)

This program has a decidedly object-like flavor to it. Where did you learn to write widget programs, Robbie?

Cheers,

David

P.S. Even after all these years, I'm still afraid to write widget programs without an XMANAGER call to get them going. I'm afraid I'll confuse the small following I have left. :-)
