Hi dear IDL user,

Maybe my question is too obvious, but I can't guess the response.

Having the vector:

```
IDL> u = [!values.f_nan, 1, 2, 3]
```

why is different the resulting vector in these following two WHERE functions?

```
IDL> print, where(u eq 3)
```

```
0      3
```

```
% Program caused arithmetic error: Floating illegal operand
```

```
IDL> print, where(u ge 3)
```

```
3
```

```
% Program caused arithmetic error: Floating illegal operand
```

Any response would be appreciated.
