Requesting info / suggestions:
I have a rotating vector - direction and magnitude. I wish to plot it in a
sequence, so e.g. at time t=1.2, vector points North-East with a certain
magnitude, time t=2.3, vector points North-West, time t=2.5, vector points
South and so on (times ordinates are unevenly spaced). What is the best way
to plot the rotating vectors in a single sequence, of say a couple of
hundred ?
