Hi,

I am trying to write a widget program were buy passing the cursor over a contour plot a varying 2d plot changes according to the value where the cursor lies. I have a contour window with two boxes below that display the corresponding x and y values from the cursor location. So, i want to take the x value to produce a corresponding plot of the contour values against the y value.

How do i take the x value and use that to generate a new plot?

many thanks

Clive Cook
