Hello,
many people and colleagues have asked for the possibility of
processing 16bit grey images with the interactive image processing
application IQM. There is now a new version (v.1.11) available. Most
imaging processing steps can be calculated with 16 bit images too.
Negative values (e.g. phase values) are not allowed. I tried and
tested it with some NMR sample images.

If you are interested, look at the history link (for the update news)
or at the tutorial link (for a complete description of IQM) at:
http://www.uni-graz.at/people/ahammer/IQM/index.htm

If you write me an e-mail I will forward you the download password.

Best Regards,
Helmut Ahammer
