
Subject: IDLDE and for-next loops

So here's a question that I've had for a bit, for those of you who use IDLDE. Say I want to test the following algorithm:

```
For I eq 0,9 do begin
  print,I
  print,I+1
Endfor
```

The key here is I can't put a "single line" for next loop (like "for I eq 0,9 do print,I" which I can just type into the command line of IDLDE and it'll work). How do I test this in the command line of IDLDE?
