I'm no expert in this area, but typically for DLMs or DLLs to be found automatically, they have to be in the IDL bin directory. If they are not, they can be pointed to with the !DLM\_PATH system variable.

Cheers,

David

ah, thanks David!

That solves the problem nicely.

Kinda weird how loading the file when IDL opens gets around that though.

Cheers. bob

You have IDLDE set to "change directory on open" and IDL searches the local directory, then the DLM\_PATH for your .dlm.

So if you open your file up in IDLDE, the local directory is changed to the directory containing your .dlm and IDL finds it. If you compile your file from the command line your local directory is unchanged and IDL can't find your .dlm.
