Subject: Multiple plotting windows?

Hello all:

First of I would like to say that I really like the tone of this group.

I've been reading this group and a group on Mandrake Linux for a few weeks now, and boy is there a difference. Please keep up the good work.

Now to my question. Say I plot a data set via the usual methods, i.e.

```
plot, values.solar[*], values.solar[*], blah blah blah.
```

Then window pops up with the plot and the title "IDL 0" in the title bar. What I can't figure out is how to plot a new data set in a new window, which leaves the original window undisturbed. There seems like there should be a simple keyword for this but I can't seem to figure it out (I've read the relevant IDL docs several times, the closest thing is !p.multi but that doesn't do it).

I'm sure it is something simply and silly, but I would greatly appreciate your assistance. Thanks in advance!!

Best,

John
