I've finally reached an impasse in my IDL programming.  Arrays just
aren't doing it for me anymore.  As of a few minutes ago I starting
teaching myself IDL pointers.  Does IDL already have implementations of
the common data structures such as stacks, queues and trees or will I
need to compose my own?  I figured it was easier to ask the group and go
to bed (it's 1:30AM local time) and see responses in the morning than
trying to slog through IDL documentation at such a late hour.  Although
the documentation would probably make better sense now...
