Hello,

First off, I'd like to say that I am a real newbie to IDL and this is the first time that I've heard of the HDF file format. I have bought Dr. Fanning's excellent book and am aware that there is a chapter on working with HDF files. I would be grateful if someone could help me figure out what it is I must do to achieve my goals.

My first goal is to simply read an HDF file (which was given to me by my lab partner - I am a programmer, not a scientist) that contains rainfall precipitation data as an image and display it using IDL (essentially get the same image as when I open it with ENVI).

I have tried running the code found in the "coyote" folder called "hdfread" but the program halts in the middle and gives the following error message:

```
% Compiled module: TEST_ISHDF.  
% Compiled module: HDFREAD.  
IDL> hdfread  
% Compiled module: PICKFILE.  
% Loaded DLM: HDF.  
Valid HDF file. Opening "E:\IDL_Programs\trmm_data\3B42.991231.6.6.HDF"  
Reading number of datasets and file attributes in file ...
```

```
No. of Datasets:      2  
No. of File Attributes: 2  
No. of Palettes:      0
```

```
Printing name of each file attribute...  
File Attribute No. 0: CoreMetadata.0  
File Attribute No. 1: ArchiveMetadata.0
```

```
Printing name of each data set and its associated data attributes...  
Dataset No. 0: precipitation
```

```
Dataset No. 1: relativeError
```

```
% HDF_SD_SELECT: Unable to select the HDF-SD dataset (NEWFILEID).  
% Execution halted at: HDFREAD      60  
E:\IDL_Programs\coyote\hdfread.pro  
%          $MAIN$
```

I believe that my data doesn't have the HDF_SD dataset. How to work around this?

I would then like to "process" the data. More explicitly, I'd like to divide the picture into $n \times n$ pixel regions, extract the value of each pixel, compute the average value of that region and compare it to a threshold value. If the average value is less than the threshold value I want to assign the whole $n \times n$ pixel region (i.e each pixel in that region) a value of -99 else I want to assign the whole region the computed average value. I'm not sure how to go about doing that, but perhaps I am getting ahead of myself.

Thank you for your time and help,

Vinit
