Hi,

I've completed the installation of IDL 3.6.1 on a DEC AXP with OSF/1 without problems. However, when I try to run it the following message appears

28135:/afs/software/idl/axp361/bin.alpha/idl: /sbin/loader: Fatal Error:  
Main 's RLD\_VERSION is 3, the correct version should be 2

and IDL is aborted.

Version 3.5.1 continues to run fine on the same CPU, and 3.6.1 runs fine on AIX also.

Any clue ?
