Hello,

I am new in IDL and I am trying to fit my data (x,y coordinates) in a function of this form:

$$y(x)=A/[(1+x/B)^{1/2}]^2$$

so that I can calculate A and B.

I have read the documentation but I am very confused as to how I should set up my function to use it at the curvefit.

Could you please explain to me how to set up the function and how to use curvefit correctly?

Thank you,
Nolan Smith
