When you stopped the code running, did IDL open the source code file in  
its editor at the line where you interrupted it? Perhaps you  
inadvertently modified the code by pressing a key then.

Perhaps there are references in the code to functions that are not on  
the !PATH. IDL might accept these if the functions have already been  
compiled manually, but not when it's restarted.

You might want to look closely at the compile error messages and the  
lines that seem to trigger them. If they don't make sense to you, you  
could post them here.

Thanks a lot!

I find the problem and as you pointed out, I need reset the path for  
the functions to run properly.
