1.) Force the bar plot of fewer data points to be the same size (same
number of bars) as the larger plot.  If both plots have the exact same X
axis, they should line up.  Of course, you'll need to put in extra bars
(i.e. data points), so I don't know if that will mess up anything else
in your graphic.

or

2.) Ditch multiplot and set the positions of each plot exactly.  You can
make the plot of fewer bars smaller in the X direction which should
reduce the bar width somewhat.  However, other attributes of your plot
will be scrunched along with it, so this might not be what you want.
