
Subject: IDL 6.2 and ITools view_title keyword

I really appreciate that RSI added a view_title keyword to their itools routines. Makes my life much easier compared to what I had to do in 6.1. However, I notice that if you use the view_next keyword along with view_title, the annotation doesn't get erased. In other words the titles keep plotting on top of each other. Any one have a quick suggestion on how to delete the annotation layer?

Cheers,
Tony
