I've posted something like this last week. However News is a bit flaky here at the moment so if you have any responses please e-mail me. I had a couple of responses via e-mail, but none via News. So if you did reply by News, it didn't reach me so could you E-mail please?

We are going for quality certification (BS5750/TickIT/ISO900X/EN29000). As part of this we need a style guide for programming in PV-WAVE. I was wondering if there is in existence we could either refer to or we could use as a starting point. I know about chapters 10 & 11 of the Programmer's Guide volume of the documentation for PV-WAVE version 4.2. Which is about the only official thing I know about. The style guide would not just include how to lay things out in the code ie typographic conventions, but also programming conventions, ie things you should do like check if the supplied variables exist or how many were supplied.

Thanks in advance,  
John Black
