
Subject: Number precision using READ_ASCII

Hi,

I'm using READ_ASCII to read a text file, like this:

```
; ENVI Point Collection
; projection info = {Geographic Lat/Lon, WGS-84, units=Degrees}
; Image X, Image Y, Lat, Lon
    1997.00    3636.00    -24.572741    -53.650743
    1923.00    3572.00    -24.555407    -53.672654
```

I'm reading only the lat/lon values, but it cuts the last to numbers.
Example:

-53.650743 is being read as -53.6507

How can I avoid it?

Thanks,
Júlio
