---

thank you for those whole helped in the previous topic "Poscript Component Selection". I am trying to select each component of the postscript file i generated in IDL, but now my image doesn't allow me to select axis, etc individually in illustrator. I used IDL\_container in the implementation. I was told that i could use the vector keyword if I used IDLgrClipboard, but how can I do it with IDL\_container? Thanks for your time. I appreciate your help.
