
Subject: Displaying Multidimensal Data

I've got a situation where I need to display a multidimensional array in a widget_text. The only way I can figure out how to do it is to create a complex structure of nested for loops for each dimension. Something similar to how print displays the data would work (as long as I could add an index before), but I can't get that output into a variable.

Does anyone know of an elegant method for displaying multidimensional data in IDL?

Thanks for any help.
