Hi, I have a little problem.

I need to read a XML file where some elements contains binary data.
This data is compressed with qcompress and quncompress (from the Qt library) that uses zlib, the same as 'open' COMPRESS keyword in IDL.
I need to uncompress these arrays of data.

Is there any function out there that brings me the possiblity to
compress and uncompress a byte array instead to read a compress file
(like open) ??

Thanks.
