Subject: reading a ninary file Posted by claire.maraldi on Mon, 09 Jan 2006 09:21:20 GMT View Forum Message <> Reply to Message

Hello,

I have to read a binary file containing long, fix and string variable type. I know that the string variable type are coded only on one byte (this have been confirmed by someone in the laboratory, and even if I try more bytes there is an "encountoured before end of file" error...). So I have tried to convert only one byte, and the results are amazing characters like "_-", "_"....

I know that is not a problem of discrepency when the binary file is read because long and fix variable type are well converted (wether they are placed before or after string).

Could explain me what exactly happen please? Thank you
