Subject: display line numbers in idlde?

Ok, my preferred solution would actually be to running idl locally (as
opposed to ssh to a server) in Linux, editing in kwrite, at full
resolution of my laptop, but since I don't feel like wrestling with the
Sisyphean task of achieving all that while trying to get something
done, I ordered the Windows version of IDL. I'm using idlde because I
can't get idl to compile the pro files in my current working directory
-- it compiles the library routines I call but won't compile my files
when called. idlde allows my to load them all at once and compile them
all at once, but I still need line numbers because ctrl+g is cumbersome
to be constantly hitting about every minute. So, is there a way to get
idlde to show line numbers of the currently displayed file?

What do you need line numbers for? Setting breakpoints? The DE should
provide that capability (haven't checked it myself in years), or if not,
IDLWAVE does.
