IDL picks the values in the order they are given.

ie. First all of gi's values are read and then all of gj's

If you get them in the right order it works:

IDL> print,

String(Format='("g",i4.4,i3.3)',[transpose(gi),transpose(gj)])

g1010509 g1007510 g1006510 g1011509 g1009509

Cheers,

Marc
