Hi all

I want to get `widget_id` of the zoom screen opened when I load a image using the `envi_display_bands`.

I am able to get the ID of the base widget from Image screen using `envi_disp_query`, `disp`, `base=base`, where `base` return the widget id for the base widget. I am also able to get the window number for all screens (image, scroll, zoom) using the keyword `w1` on `envi_disp_query`.

Does any one know?

Thanks a lot

Vinicius
