Eh!

Why put it in the rsi system lib. (and possibly loose it if your IDL
needs upgrading or your machine dies, you back up your home directory
right? (c;) You should have a library file system of your own,
something like /home/nsmith/idl/my-files

Unpack pan into /home/nsmith/idl

Oh maybe make sure YOUR IDL_PATH variable is set correctly! For bash
shell I have the following in my .bashrc file

MY_IDL=${HOME}/idl/

IDL_PATH=.:+${MY_IDL}:

export IDL_PATH

Then when I start IDL no matter which directory I'm in pan will run
fine!

HTH, marcu
