
Subject: changed dll file names in IDL 6.3

Hi,

I have some .sav programs which ran fine in the IDL6.0 Virtual Machine. I recently needed to install the VM on a new PC, and of course the VM is now up to version 6.3.

The .sav expects to find the files idl32.dll and lib32.dll in IDL's program files, however, in IDL 6.3 these have been renamed to idl.dll and lib.dll. As a result, my .sav will not run.

I simply made copies of the two dll files and renamed them with the filenames what my .sav expects.

Is this solution likely to cause any problems - having two identical dll files (the official one and the copied one)? Is the .sav going to be using one, and IDL VM using the other?

Thanks
Dave
