Subject: iTools point symbols

I am trying to use iPlot to generate a 2D scatterplot of points, where each point is coloured according to its frequency of occurrence (like a 2D histogram and a scatterplot combined). The choice of point symbols in iPlot is only limited and I was wondering whether there is a way of adding customised symbols, such as a solid square or circle. I have been looking at some object graphics code in the gridding wizard of iContour (which produces a plot like I described above), but I am only a newbie with object graphics and to extract the section of the code that does the job seems like overkill to only change a symbol in iPlot. Any help would be appreciated.

Thanks and regards,

Arko Lucieer
