Hi folks,

I'm using Liam's imdisp routine to draw a filled contour map from the north pole. My color bar runs from dark orange, passes through light orange at data value of 0, onto deep blue (it is a change in temperature plot).

The plot looks nice, except outside of the lower latitude limit (40o N) there is a square box that is colored light orange rather than the background white. I guess imdisp is assuming this area has a data value of 0. Not what I want.

Any ideas how to make this white ?

While I'm asking

I've had to put in the latitude and longitude labels by hand, i.e. xyouts, any body know a neater way to do this?

Many thanks for any clues,

Pru
