How about

READ, inchar, PROMPT = 'give me your input : '

no... still frozen. I'm beginning to think this is a problem intrinsic to this version of IDL, or with my machine, since iplot is similarly freezing in one of the sample programs I found in the RSI tech tips: itool_add_legend.pro. only when this program completes does iplot update it's window.

Hi,

I'm not sure there is a problem. Iplot is just like any other IDL widget program. If the interpreter is busy doing something, then it cannot process widget events. Another example would be:

```
iPlot  
wait, 10
```

In your program, you are waiting for input from the command line. Did you ever enter any input?

-Chris
