I would like to create a new iPlot from within an application. I have no problem doing this from within the development environment, but when I create a .sav file for distribution and run it from the virtual machine I get the following error:

"Attempt to call undefined procedure/function:
'IDLITPARAMETERSET_DEFINE'."

I can create a new plot window graphical object, but I would like to give the user all the functionality of iPlot to modify the graph.

I'm using Windows XP both for development and running the virtual machine.

Thank you for your help.
