Dear all

I have to sort a file with 650,000 records in search of duplicate records.. and I need a list of duplicates (not a list without duplicates)...

```
indexS=sort(testTotal)
```

```
test=testTotal[indexS]
```

```
indexU=uniq(test)
```

indexU is an index with no duplicates..

how do I get an index pertaining to the duplicates only?..

please help..

thanks in advance
