Subject: help with clipping in IDL V3.0

Hi! I am trying to get my program to ignore any points outside
of the plot window, but based on my reading of the manual,
this seems to be impossible - there seems to be only 2 choices:
1) clip plot to axis, where point outside is joined to first
point inside starting at the axis, and 2) point outside is
joined with line extending beyond the axis. I hope maybe I
missed something in the manual - is there any way to get
the plot to ignore points outside the axes?? (In Version 1.0,
there was an option to do this, called IGNORE).

Thanks for any help!!
