I'd like to know if there is a method to pass an object to IDL_IDLBridge session.

Of course, it is impossible to pass pointers and objects via "setVar" method.

In that case, is there any bypass?

I hope there is an easy method.

Thanks for reading.

The documentation says you can't do it. I think your only "trick" to get around it would be to send over any relevant data you would need to initialize a new object. Of course it not be connected in any way to your original IDL session, so you would some other means to communicate with that object.
