I'm very disappointed. I had a beautiful solution to a problem which involved determining if all the elements in one array exist in a second using histogram, but apparently I can't do that with string arrays. Oh well, I think I've seen something else in the built in library that'll do it just as fast and easily.

I was very firm with Google when I signed up. "This crowd is already oversexed," I told them, "we don't need any more Viagra ads!!!"

Cheers,

David

P.S. When I load my own pages locally I am continuously served up ads for rabbit calls, ammo, and camouflage clothing. I wouldn't have thought killing coyotes, which is pretty much what we did in Arizona in the 1950's for fun, was still such a popular sport. Some people never grow up, I guess. :-)

I wonder, does google get my IP, and place specific adds
based on their history of my google searches, is that how that
stuff works?

I would think I would get more Angelina Jolie ads, but infrared
imaging also seems a bit targetted.

Cheers,
bob

PS It is probably those major league baseball satellites
that are constantly spying on me.

Ok. Done.

Well, for a long time. BSORT was written in 1990 to solve that
problem, I think.

Cheers,

David
