I can't help with your main question, but perhaps there is a different route. Have you experimented with the virtual machine? I use this for all my batch operations now, as it requires no license and can run on pretty much anything if you write the code to interact with the environment carefully.

cheers,

Ben

Dear Ben,
I've done a quick research into VM and indeed it seems to be a possible solution, although I'm not sure whether you can feed it with files. Nevertheless, I am working with a very old idl version (5.5) and can't create .sav files that will be acknowledged in VM.
Thanks for the suggestion.
Remko
