
Subject: idlde called from other scripts

Hi all,

I encounter problems with opening IDLDE from a batch file (windows).

That will say, when running the batch, idlde opens correctly, but when I call the batch file from another applet, idlde opens in demo mode as the license wasn't found.

(I make use of full path names)

Can anyone give a suggestion how I can use the full licensed version? (I don't think that the problems are caused by the applet, but I make use of EFTS from EUMETSAT).

Many thanks,
Remko

ps. this question was also asked in the "IDL with command line like input, (in EFTS -EUMETSAT)" topic, but I believe it is another issue.
