Hello,

I use IDL under OSF and Alpha. I am very new user of IDL and now I have encountered a problem, which seems to be too tough for me, so pardon me if the solution to the problem is trivial.

How can I get different widgets in different windows to forward events they get and handle? Now I am registering the widgets into Xmanager separately, so they occupy a different window each. They seem not to be able to send events to the widgets in the other windows. Is Xmanager improper routine in this case? Is there any options for that? Or is there any way to have a common base widget for two sub widgets residing in two different windows?

I hope I made myself clear enough.

Thanks in advance.
