I've searched this news group and find that someone set the WAVE_STARTUP variable, I tried to set WAVE_STATUP=~/.idl_startup.pro in my .bashrc, and then export WAVE_STARTUP, but this didn't work at all. What's the reason? Is the system variable I've defined not proper? By the way, The IDL_STARTUP variable points to the same startup file, and it works fine when I start a IDL session under terminal.

Best regards,

Robert Chuang
