
Subject: widget sizing

Hi,

Imagine this: you have a base widget, containing a tab widget and one of the tabs contains a multiline text widget. Since the number of lines can be too much, I use "ysize=nlines,scr_ysize=200,/SCROLL" when creating the text widget.

Now the tab widget resizes according to the screen size of the text widget, but the base widget doesn't. It's still as big as if you wouldn't use "scr_ysize=200,/SCROLL".

Am I missing something or is this "normal" IDL behaviour?

Thanks.
