Hi all,

Example:

I have a variable named "aa" with an height value for example, and a vector "vb" with many height values. When I do this

```
dif = ABS(vb - aa)  
mindif = MIN(dif)
```

there is any way to get the index for "dif" where the minimum difference are?

Cheers,
Marie

SN: Anyone can advice me documentation about index manipulation with various data?
