```

I'm using IDL 6.1 on sparc sunos and your code works fine:

```
IDL> print, ladfit(xcut,y)
% Compiled module: LADFIT.
      0.00000000      1.60000000
```

BTW - how about using:

x = sin(2\*!pi/15\*dindgen(100))

```

Hmm...

Sounds like a plan. Thanks for pointing out. I have many applications where to do this instead of nasty loops.

Best regards,  
Ingo
