One thing that you have to worry about with the iTools is that they, like any IDL widget program, do not respond to user actions when the interpreter has stopped (because of a breakpoint, crash, etc.). You could "plot, x, y" to check a variable, but "iplot, x, y" would plot and then freeze.

Not sure if that is your situation but it is an idea.

Mike

Thanks - I think that was the problem.

Anthony
