Kevin,

Tho I don't have/never used ENVI before, this is not an ENVI problem.
I can guess from past experience that these scripts are probably not
there. So I suggest that you copy the necessary tar files onto /usr/
local/envi or whatever directory you choose and untar them
individually and if needed create the links yourself inside
your .bashrc (or for the shell you are using). I made my copy of IDL
work like that (scripts - post_unpack etc. - were missing). I ain't
complaining, but ITTVIZ' GNU/Linux support could be a lot better. But
of course, there is this forum :-)

Hth,

/rk

Hi I am having trouble too, installing IDL6.0 in Ubuntu 7.04. I have quite new to all this, and I am experiencing the same problems of Kevin.

Could you please help me explaining me the procedure? I don't understand which tar files I have to copy, and where and how I have to untar them.

Please help me!

Thanks Pol
