I am trying to compile Fortran code to be called from call_external on Mac OS X. I am using GCC in an x-terminal. Would I have to create a .dylib file, and if so, how would I do that? I have a PPC architecture machine. Any help would be greatly appreciated.

Do a search on this group for "call_external fortran with OS X" for a short thread

(2 posts, both from me) where I made this work for myself. (Not sure if and what the difference is between *.so and *.dylib, but I use *.so files.)

I've now moved on to Intel architecture Mac OSX machines and have found Intel's compiler excellent. But, you're on PPC, so what I wrote in that old thread should work.

cheers,
-Henry
