
Subject: storing spectra into HDF

Hi All,

I have spectra (just fluxes) of variable sizes and I would like to store them into HDF. I do the following:

1. crop spectra to the same size first,
2. in a for-loop I read them into 2D array (flux[4400,i]; 4400 is lambda point and i-th spectrum)
3. store them into HDF after like: HDF_SD_ADDDATA, sds_id, flux

I was wandering, is it posible to store the whole spectra (with variable sizes) and how?

thanks
oliver
