
Subject: byte offset in POINT_LUN

as i'm cruising through, reading a large ascii file, I'd like to keep track of the beginning of certain "blocks" of code. in the event that i find what i'm looking for within the block, I'd like to PRINTF the entire block (the beginning of which is now above my file position). I've used POINT_LUN to return to the start of a file before, by setting position=0, but is there a way I can use POINT_LUN to go to a specific line within the file (since I'm not sure how that would correspond to a byte offset) ?
