Good day everyone

i'm little confused by IDL terminology. objects are created by OBJ_NEW function

```
myObject = OBJ_NEW('ClassName')
```

Does ClassName - object or class ???

myObject is reference to ...what ???

And question without object programming

i have two variables

```
A = 10
```

```
B = PTR_NEW(10)
```

where are A and B stored ? value '10' for B variable in heap (heap PC or heap IDL VM ???) how about A variable ?
