
Subject: Rotating axis labels

Hi everyone,

I am trying to format some plots to look nice for a presentation and I am having trouble with my tick labels on the x axis. Each label is a variable name and there are 20 of them, so just printing them under the axis makes them all run together and thus illegible. Is there some way after setting the xtickname to an array of variable names to then rotate each name so that it can sit at maybe a 45 degree angle or perpendicular to the axis?

Thanks,
Melanie
