
Subject: making a circle of certain values

Hi,

I have a set of data points (x,y coordinates) that can be plotted on my 1240,1024 array. However, they are sparse x,y spots across the image, and I want to 'thicken' it by drawing a circle with my x,y as centers. I want to give it a certain radius and a certain value too, so that the pixels in the circle (the filling) have values and can thus contribute to my rgb image...
anyone know how to draw a circle, and assign a value to pixels within that circle?

Thanks!

RP
