If you have ENVI use class_doit...

Otherwise you're limited to unsupervised classification as far as i see.

Since you have little a-priori information about your clusters (visually) cluster weights may be equal for all clusters. does this help in any way?

One other thing you could try would be to draw a histogram, maybe smooth a little, find local minima, and cluster your data according to that.

if you do not advance after a few tests you can send a small subset (up to 2MB) to my mail.

cheers,
Tal
